# Symmetry Handling in Binary Programs via Polyhedral Methods 

## Christopher Hojny

joint work with Marc Pfetsch

Technische Universität Darmstadt Department of Mathematics

$\Rightarrow$ Discrete<br>Optimization

2016 International Conference on Mathematical Software

## Motivation

- Consider a necklace with $n$ black (0) and white (1) beads.
- Associate with a necklace a vector in $\{0,1\}^{n}$.
- necklaces $x, x^{\prime} \in\{0,1\}^{n}$ are "equal" $\Leftrightarrow \exists$ cyclic shift $\gamma$ such that $\gamma(x)=x^{\prime}$.

## Motivation

- Consider a necklace with $n$ black (0) and white (1) beads.
- Associate with a necklace a vector in $\{0,1\}^{n}$.
- necklaces $x, x^{\prime} \in\{0,1\}^{n}$ are "equal" $\Leftrightarrow \exists$ cyclic shift $\gamma$ such that $\gamma(x)=x^{\prime}$.

1 shift

## Motivation

- Consider a necklace with $n$ black (0) and white (1) beads.
- Associate with a necklace a vector in $\{0,1\}^{n}$.
- necklaces $x, x^{\prime} \in\{0,1\}^{n}$ are "equal" $\Leftrightarrow \exists$ cyclic shift $\gamma$ such that $\gamma(x)=x^{\prime}$.

2 shifts

## Motivation

- Consider a necklace with $n$ black (0) and white (1) beads.
- Associate with a necklace a vector in $\{0,1\}^{n}$.
- necklaces $x, x^{\prime} \in\{0,1\}^{n}$ are "equal" $\Leftrightarrow \exists$ cyclic shift $\gamma$ such that $\gamma(x)=x^{\prime}$.

3 shifts

## Motivation

- Consider a necklace with $n$ black (0) and white (1) beads.
- Associate with a necklace a vector in $\{0,1\}^{n}$.
- necklaces $x, x^{\prime} \in\{0,1\}^{n}$ are "equal" $\Leftrightarrow \exists$ cyclic shift $\gamma$ such that $\gamma(x)=x^{\prime}$.

Question: How can we characterize (the convex hull of) a representative system of "distinct" necklaces?

## Outline

## Symmetry Detection

## Representative Systems

## Symretopes and Symresacks

## Numerical Experiments

## Symmetry Detection

Consider binary program (BP)

$$
\max \left\{c^{\top} x: A x \leq b, x \in\{0,1\}^{n}\right\}
$$

We can distinguish two types of permutation symmetries of BP:

## Problem Symmetry Group

Contains all permutations $\gamma \in \mathcal{S}_{n}$ with

- $A \gamma(x) \leq b \quad \Leftrightarrow \quad A x \leq b$ and
- $c^{\top} \gamma(x)=c^{\top} x$.

## Formulation Symmetry Group

Contains all permutations $\gamma \in \mathcal{S}_{n}$ for which there is $\sigma \in \mathcal{S}_{m}$ s.t.

- $\gamma(c)=c$,
- $\sigma(b)=b$, and
- $A_{\sigma(i), \gamma()}=A_{i, j}$.

## Symmetry Detection

Consider binary program (BP)

$$
\max \left\{c^{\top} x: A x \leq b, x \in\{0,1\}^{n}\right\}
$$

We can distinguish two types of permutation symmetries of BP:

## Problem Symmetry Group

Contains all permutations $\gamma \in \mathcal{S}_{n}$ with

- $A \gamma(x) \leq b \quad \Leftrightarrow \quad A x \leq b$ and
- $c^{\top} \gamma(x)=c^{\top} x$.
- NP-hard

## Formulation Symmetry Group

Contains all permutations $\gamma \in \mathcal{S}_{n}$ for which there is $\sigma \in \mathcal{S}_{m}$ s.t.

- $\gamma(c)=c$,
- $\sigma(b)=b$, and
- $A_{\sigma(i), \gamma()}=A_{i, j}$.
- Graph-Isomorphism-hard

## How to Determine Formulation Symmetries?

Build an auxillary colored graph and determine its color preserving automorphisms.

## How to Determine Formulation Symmetries?

Build an auxillary colored graph and determine its color preserving automorphisms.

| $\max x_{1}+x_{2}$ |  |
| :---: | :--- |
| $x_{2}$ | $\leq 1$ |
| $x_{1}$ | $\leq 1$ |
| $2 x_{1}+2 x_{2}$ | $\leq 2$ |

## How to Determine Formulation Symmetries?

Build an auxillary colored graph and determine its color preserving automorphisms.

Automorphism group can be determined, e.g., with

- bliss,
- nauty, and
- saucy.

## Outline

## Symmetry Detection

## Representative Systems

## Symretopes and Symresacks

## Numerical Experiments

## Orbit Representative Systems

Given a symmetry group 「 of a binary program (BP), how can we determine a representative system of the orbits

$$
\Gamma(x)=\{\gamma(x): \gamma \in \Gamma\},
$$

where $x$ is feasible for $B P$ ?
Idea: Add

$$
a^{\gamma \top} x:=\sum_{i=1}^{n}\left(2^{n-\gamma(i)}-2^{n-i}\right) x_{i} \leq 0
$$

for each $\gamma \in \Gamma$ to $\mathbf{B P}$.

## Pros and Cons

## Pros

- $a^{\gamma^{\top}} x \leq 0$ cuts off symmetric solutions
- $\left\{x \in\{0,1\}^{n}: A x \leq b\right\} \cap$
$\bigcap_{\gamma \in \Gamma}\left\{x \in \mathbb{R}^{n}: a^{\gamma \top} x \leq 0\right\}$ is lexmax representative system of BP, see [Friedman, 2007]

## Cons

- coefficients of $a^{\gamma^{\top}} x \leq 0$ grow exponentially large
- possibly many inequalities, one for each $\gamma \in \Gamma$

## Outline

## Symmetry Detection

## Representative Systems

## Symretopes and Symresacks

## Numerical Experiments

## Symretopes

## Definition

Given $\Gamma \leq \mathcal{S}_{n}$, the symretope w.r.t. $\Gamma$ is the polytope

$$
S(\Gamma):=\operatorname{conv}\left(\left\{x \in\{0,1\}^{n}: a^{\gamma^{\top}} x \leq 0 \forall \gamma \in \Gamma\right\}\right)
$$

## Symretopes

## Definition

Given $\Gamma \leq \mathcal{S}_{n}$, the symretope w.r.t. $\Gamma$ is the polytope

$$
\mathrm{S}(\Gamma):=\operatorname{conv}\left(\left\{x \in\{0,1\}^{n}: a^{\gamma \top} x \leq 0 \forall \gamma \in \Gamma\right\}\right) .
$$

- If $\Gamma$ is given by generators, the optimization problem over symresacks is NP-hard.
- There is $\Gamma \leq \mathcal{S}_{n}$ such that the coefficients of facet inequalities grow exponentially.

To avoid exponential coefficients, find tractable IP-formulation for symretopes with small coefficients.

Idea: Consider 0/1-knapsack polytope induced by $\mathrm{a}^{\gamma \top} x \leq 0$.

## Symresacks

## Definition

Given $\gamma \in \mathcal{S}_{n}$, the symresack w.r.t. $\gamma$ is the polytope

$$
P_{\gamma}:=\operatorname{conv}\left(\left\{x \in\{0,1\}^{n}: a^{\gamma \top} x \leq 0\right\}\right) .
$$

## Properties

- non-standard knapsack polytopes,
- feasible points can be completely characterized by minimal cover inequalities and box constraints,
- in general, there are exponential many minimal covers

## Separation Complexity

## Theorem

The separation problem of minimal cover inequalities for $P_{\gamma}$ and $\bar{x} \in \mathbb{R}^{n}$ can be solved in time $\mathcal{O}\left(n^{2}\right)$.

Consequences: Symmetry handling is possible with $\{0, \pm 1\}$-inequalities:

- separate minimal cover inequalities of $P_{\gamma}$ instead of adding $a^{\gamma^{\top}} x \leq 0$,
- separation is possible in time $\mathcal{O}\left(|\Gamma| n^{2}\right)$,
- avoid exponential coefficients.

## Propagation Problem

Input: Upper and lower bounds $u, I \in\{0,1\}^{n}, \gamma \in \mathcal{S}_{n}$ Questions:

- Is there a vertex $x$ of $P_{\gamma}$ with $I \leq x \leq u$ ?
- Can we tighten some bounds?

## Propagation Problem

Input: Upper and lower bounds $u, I \in\{0,1\}^{n}, \gamma \in \mathcal{S}_{n}$ Questions:

- Is there a vertex $x$ of $P_{\gamma}$ with $I \leq x \leq u$ ?
- Can we tighten some bounds?

|  |  |  |  |  |  |  | 1 | $x_{i}$ | $u$ |

## Theorem

The propagation problem for $P_{\gamma}$ can be solved in time $\mathcal{O}(n)$.

## Outline

## Symmetry Detection

## Representative Systems

## Symretopes and Symresacks

## Numerical Experiments

## Implementation

- implemented constraint handler for symresacks in SCIP 3.2.1 containing
- separation of minimal cover inequalities,
- propagation rules,
- resolution methods if propagation detected infeasibility,
- implemented constraint handler for orbisacks [Kaibel and Loos, 2011] which are symresacks for $\gamma=(1,2)(3,4) \ldots(2 n-1,2 n)$
- use automated symmetry detection methods of [Pfetsch and Rehn, 2015],
- use CPLEX 12.6.1 as LP-solver

## Numerical Experiments

tests were run on

- Linux cluster with Intel i3 3.2GHz dual core processors,
- 8GB memory,
- single thread
- time limit: 3600 seconds
test instances
- MIPLIB 2010 benchmark
- SONET network design [Sherali and Smith, 2001]
- Wagon Load Balancing [Ghoniem and Sherali, 2011]
